

INFORMATION SHEET

Transaction Network Services (TNS) is one of the leading providers of cost-effective payment and data communication services worldwide.

SecureCXL is a PCI-DSS certified managed payment service, providing merchants with a secure, reliable, Cost-effective method of authorising and settling credit and debit card payments through a trusted partner.

SecureCXL provides a flexible, scalable alternative to in-house software and systems. The solution has a proven pedigree and is approved by all major UK and Irish banks.

With the ability to handle real-time online or batched transactions, SecureCXL offers a full function outsourced solution that supports card-present Chip and PIN as well as card-not-present transactions. The solution also offers a real-time online transaction search and management tool, accessible through a standard web browser.

SecureCXL includes a simple, convenient method for merchants that manually enter card details for card-not-present transactions. This easy-to-use payment entry screen can be accessed securely via a web browser from any location with Internet access. This makes it especially attractive to home and remote workers.

For merchants that want to accept card payments at their web sites, SecureCXL offers a hosted payment page.

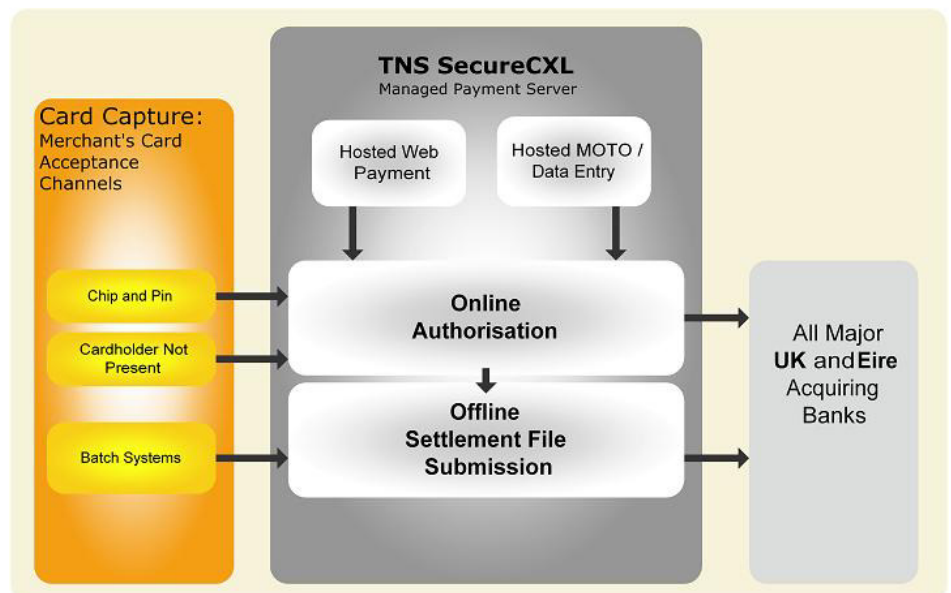

Merchants can accept Internet payments without handling sensitive card data themselves while incorporating their own branding to reinforce their identity at the point-of-payment.

Easy Integration

TNS provides the option of having one simple application interface for multi-channel retailing. Merchants can use their application of choice to capture card transactions while still taking advantage of a single payment service for authorisation and settlement. This allows for easy integration into existing business processes and eliminates the need to manage end-to-end systems and networks.

Alternatively, TNS offers a hosted card capture option that enables merchants to completely outsource the authorisation and capture process and keep payment data separate from their internal systems and networks. This allows merchants to outsource the responsibility for card data storage to a PCI-DSS certified partner.

Providing the highest level of security, the solution supports MasterCard SecureCode® and Verified by Visa cardholder authentication programs as well as Address Verification System (AVS) and Card Security Code (CSC/CV2).

Features and Benefits
